Perspective, by definition, has to do with how far an object appears to be. A given camera's lens has a certain width. Perspective makes objects appear smaller as they get closer to the camera. Rotation is the angle at which a surface makes a certain angle with respect to the viewer. A front surface will appear to be completely different than the back surface. If we look at a pie, we can see different angles in each slice. We understand the angle of each piece in relation to how we look at it. **So a perspective view of a pie is literally a pie? In 3D, each face

I've included the mechanism as to how the molecule is created. ◦ Read More: Materials: Phenylboronic acid - barium salt - PBA_Ba.mp4 Nitromethane - NaNO₂ - NM.mp4 This channel presents raw reactions. The explanations are usually very simple with an emphasis on understanding rather than memorizing a rule. The main goal is to learn how to react rather than learn about the reaction itself. Taught by the Department of Chemistry Professor Sam Edwards. Let's Play Chemistry: The Discovery (Generic 1.0) In an effort to bring more chemistry-based content to the channel, we are doing Let's Plays. We currently are not going to do battles or anything like that, but we will explore biochemistry concepts thanks to chemistry games and see how chemistry games (and real chemistry) can teach us about the world around us. ► Stay in touch: FACEBOOK: INSTAGRAM: ► Music: 5 Water Based Chemistry Handouts How is all that water around us structured?
